

5 U.S. Patent No. 6,211,940 B1 discloses motion picture film wherein digital sound information is stored in the space between a line or perforations on the same side of the film as the analog audio soundtrack. Since the information may be lost due to wear or mechanical damage, the system may select the analog track if the digital information is corrupted.

U.S. Patent No. 5,055,939 to Karamon et al. discloses another approach to compatibility for analog and digital formats. More particularly, the patent discloses an approach that does not require synchronizing tracks, codes, markers or time codes or other extrinsic data to be recorded on the film. Instead the standard audio itself, from the film, provides the information that controls the timing of the higher quality auxiliary sound source.

Although many approaches to supplemental audio are directed toward providing a higher quality soundtrack, the Karamon et al. patent, for example, also discloses that alternate languages can be

35 synchronized to the higher quality auxiliary sound

source. These translations would be available for selection for listening by a cinema audience or by segments of the audience sitting in preselected seating areas having listening devices assigned to respective
5 languages.

Another category of supplemental audio content is offered under the TheatreVision program created by the founding president of RP International, a non-profit organization fighting retinitis pigmentosa
10 (RP), and other blinding, degenerative eye diseases. TheatreVision makes films accessible to the visually challenged by incorporating a special soundtrack for feature films that runs concurrently with the dialogue of the picture. This track provides a descriptive
15 narration of what is being shown on the screen, so that those without sight can still experience the medium of motion pictures. Over the next few years, plans call for these special narrative tracts to be heard via headsets in theaters all over the United States.

20 As motion picture technology continues to progress, there are plans for distribution and presentation of motion picture entertainment entirely in digital format, that, is, without the current film with frames, etc. Unfortunately, a typical motion
25 picture may require terabytes of digital data. Moreover, digital projectors are very costly and still may require further technical development to be more compatible with existing film-based projectors. Accordingly, migration to an all-digital format may be
30 many years away. An all digital approach may readily accommodate supplemental audio content which can be stored along with the picture data and main soundtrack data. In the meantime, however, supplemental audio content distribution and presentation in cinemas is
35 severely hampered and complicated by requiring

0909694 062904

compatibility with existing motion picture film
equipment and formats. Moreover, delivery of the
supplemental audio content to only selected movie
patrons within a cinema may also be difficult,
5 especially where adding wiring throughout the cinema
may be cost prohibitive.

Summary of the Invention

In view of the foregoing background, it is
therefore an object of the present invention to provide
10 a system and method for efficiently and economically
providing supplemental audio content to movie patrons
in cinemas using motion picture film.

This and other objects, features and
advantages in accordance with the present invention are
15 provided by a supplemental audio content system for
providing supplemental audio content to at least one
movie patron during playing of a motion picture film
and associated soundtrack in a cinema of cineplex
comprising a plurality of individual cinemas. In
20 particular, the supplemental audio content system may
comprise a supplemental audio content player for
playing supplemental audio content during playing of
the motion picture and associated soundtrack, and a
wireless transmitter connected to the player.

25 At least one earphone may be provided to be
worn by the at least one movie patron, and the system
may also include at least one wireless receiver
connected to the at least one earphone and cooperating
with the wireless transmitter to deliver supplemental
30 audio content to the at least one movie patron.
Moreover, the wireless transmitter and wireless
receiver may preferably have operating characteristics
to avoid interference with respective supplemental
audio content systems for other cinemas of the

0909684 062904

5 the cineplex.

10 descriptive narrative audio content, such as to aid the
sight impaired.

15 demodulation, that is, include a digital demodulator.
For example, in one particularly advantageous class of
embodiments, the wireless transmitter may use spread
spectrum modulation, and the at least one wireless
receiver may use spread spectrum demodulation. The
20 spread spectrum modulation/demodulation may be either
direct sequence or frequency hopping, for example.

25 at least one selectable channel may comprise at least
one selectable radio frequency channel. Accordingly,
interference may be readily avoided between adjacent
cinemas in the cineplex by proper selection of the
frequency channels of the supplemental audio content
30 systems in adjacent cinemas.

35 receiver may also preferably operate in an unlicensed

RF band in some embodiments. For example, the unlicensed band may be in a range of about 2.400 to 2.4835 GHz, although other bands are also possible.

In other embodiments, the wireless
5 transmitter may comprise an infrared transmitter, and the at least one wireless receiver may comprise at least one infrared receiver. The infrared signals will not penetrate the walls of the cinema so that interference with adjacent systems is readily avoided.

10 The at least one wireless receiver may comprise a respective wireless receiver for each earphone. In other words, the earphone and wireless receiver may define a movie patron unit to be used by the movie patron. In addition, the movie patron unit
15 may include an earphone level control connected to the earphone to permit the patron to select an appropriate listening level.

The at least one earphone may comprise at least one open field earphone. Accordingly, the movie
20 patron can hear the music, sound effects, dialogue, etc. of the movie soundtrack along with the supplemental audio content. The supplemental audio content player may comprise a storage device for storing the supplemental audio content, and a processor
25 for reading the supplemental audio content from the storage device during playing of the motion picture and associated soundtrack.

A method aspect of the invention is for delivering supplemental audio content to at least one
30 movie patron during playing of a motion picture film and associated soundtrack in a cinema of cineplex comprising a plurality of individual cinemas. The method may include providing at least one movie patron unit comprising an earphone and a wireless receiver
35 connected thereto, and wirelessly transmitting the

09396894-062901

supplemental audio content from a wireless transmitter to the at least one movie patron unit to thereby deliver supplemental audio content to the at least one movie patron. Moreover, the wireless transmitter and
5 wireless receiver may have operating characteristics to avoid interference with respective supplemental audio content systems for other cinemas of the cineplex.

Brief Description of the Drawings

FIG. 1 is a schematic plan view of a cineplex
10 illustratively including four cinemas, each cinema including the supplemental audio content system in accordance with the present invention.

FIG. 2 is a schematic diagram of the supplemental audio content system and related equipment
15 as shown in FIG. 1 for two cinemas.

FIG. 3 is a more detailed schematic diagram of a portion of the supplemental audio system as shown in FIG. 2.

FIG. 4 is a perspective view of an embodiment
20 of a movie patron unit of the supplemental audio system as shown in FIG. 2.

FIG. 5 is a schematic diagram of a wireless transmitter and receiver as may be used in the supplemental audio system of FIG. 2.

25 FIG. 6 is a schematic diagram of another wireless transmitter and receiver as may be used in the supplemental audio system of FIG. 2.

FIG. 7 is a schematic diagram of yet another wireless transmitter and receiver as may be used in the
30 supplemental audio system of FIG. 2.

Detailed Description of the Preferred Embodiments

The present invention will be described more fully hereinafter with reference to the accompanying

09896894-062904

drawings, in which preferred embodiments of the invention are shown. This invention may, however, be embodied in many different forms and should not be construed as limited to the embodiments set forth
5 herein. Rather, these embodiments are provided so that this disclosure will be thorough and complete, and will fully convey the scope of the invention to those skilled in the art. Like numbers refer to like elements throughout, and prime and multiple prime
10 notation are used to indicate similar elements in alternate embodiments.

Referring initially to FIG. 1, the supplemental audio content system in accordance with the present invention may be used in a cineplex **20**
15 including a plurality of individual cinemas **21a-21d**. Indeed, in the illustrated embodiment of the cineplex **20**, each of the cinemas **21a-21d** includes a respective supplemental audio content system **30a-30d**. Each of the supplemental audio content systems **30a-30d** is connected
20 to a respective movie film projector **23a-23d**. In other embodiments, not all of the cinemas **21a-21d** need be so equipped as will be appreciated by those skilled in the art. The number of cinemas **21** in a cineplex **20** may vary, with twenty or more cinemas not uncommon.

Each of the cinemas **21a-21d** includes a
25 respective room **22a-22d** with a screen **24a-24d** at the forward wall thereof to display the projected movie image. The rooms **22a-22d** illustratively include doors **26a-26d** which open into a common hallway. Stairs **33a-33d**
30 **33d** lead alongside the illustrated seating areas **32a-32d** as will be appreciated by those skilled in the art. Of course, other room and seating configurations are possible and contemplated by the present invention.

090694 062004
T06290" 4689660

5 Accordingly, the hexagons in FIG. 1 are used to schematically indicate those movie patrons using the supplemental audio content system, such as by using the movie patron unit **50** as will be described in greater detail below.

Each projector **23a, 23b** may of the type that uses DOLBY® processing to produce a bitstream of identification data during playing. In particular, the identification information may include at least one of a reel identification, a frame identification, and a frame portion identification. For example, the reel may be identified with a number, such as reel 6, and the frame and frame portion may be identified with a continuous running number count or film block number.

In view of the typical number of frames, and since each frame may be divided into four portions, the block number may range from 0 to about 260,000, depending on the length of the motion picture..

Digital data packets may be encoded in two-dimensional blocks, with four blocks for each picture frame, for example, on the film. Since twenty-four frames are commonly shown per second, 96 data packets are output per second. Each data packet may include 32 bytes of identification information. Further details

5

10

15

25

The supplemental audio content can also be received via satellite distribution (point-to-multipoint) or via a point-to-point communications

link, eg. microwave link, as also schematically illustrated. Of course, in other embodiments, the server **41** may acquire the supplemental audio content as data stored on digital disks, digital tapes, or other
5 similar physically transported media.

The server **41** is illustratively connected to each of the projection room personal computers **40a**, **40d**, such as via a wired or wireless local area network (LAN) as will be readily appreciated by those skilled
10 in the art. As will also be appreciated by those skilled in the art, the server **41** may not be needed in other embodiments.

One important aspect is that the supplemental audio content signals during playing can be distributed
15 or delivered to movie patrons in the cinema via a wireless communications link. More particularly, as schematically shown in FIG. 2, each personal computer **40a**, **40d** may be connected to a respective wireless transmitter **42a**, **42d**. The wireless transmitters **42a**,
20 **42d** then communicate with corresponding wireless receivers in the respective movie patron units **50a**, **50d** as will also be described in greater detail below. The wireless link may be infrared or radio frequency (RF) as also described in greater detail below. These
25 approaches may be employed to reduce the likelihood of interference between adjacent cinemas **21a-21d** in the cineplex **20**.

Referring now additionally to FIG. 3, various processing steps and portions of a supplemental audio
30 content system **30a** are now described. For clarity of explanation, only a single system **30a** will be described in detail, and those of skill in the art will recognize that the other systems in the cineplex **20** may be the same or similar.

0969694-062901
T06290-4696960

The system **30a** includes a clock **50a** connected to the time tagger **51a**. The clock **50a** may be the clock or the personal computer **40a** or derived therefrom, as such provides an accurate "wall clock" source for
5 further processing. The time tagger **51a** deformats the identification data packets output from the projector **23a**. The time tagger **51a** also time tags or associates with the data, a time based upon the clock **50a**. In other words, the time tagger **51a** cooperates with the
10 clock **50a** for generating time tagged identification data based upon the identification data from the motion picture film **34a** during playing thereof.

The time tagger **51a** is illustratively connected to a synchronizer **52a** for synchronizing
15 playing of the supplemental audio content with playing of the motion picture film **34a** and associated soundtrack and based upon the time tagged identification data. More particularly, the synchronizer **52a** may play the supplemental audio
20 content at a play rate based upon the time tagged identification data to synchronize with playing of the motion picture film. In addition, the synchronizer **52a** may also skip ahead or wait while playing the supplemental audio content based upon the time tagged
25 identification data to synchronize with playing of the motion picture film. Skipping ahead, for example, may be desired where splices have been made to the motion picture film and a number of frames have been deleted, as will be appreciated by those skilled in the art.

30 To perform these functions, the synchronizer **52a** may include a time base generator **54a** for generating a time base signal based upon the time tagged identification data, and an output stage **55a** for playing the supplemental audio content at a rate based

090684-06901

upon the time base signal from the time base generator **54a**. To improve synchronization, the illustrated synchronizer **52a** also further comprises a time base correction controller **56a** for adjusting the time base generator **54a** based upon the time tagged identification data. In other words, the time base correction controller **56a** may provide feedback control to follow the rate of playing of the motion picture film **34a** which can vary. The playing rate may be varied slightly without causing undesired changes in pitch of supplemental audio content as will be appreciated by those skilled in the art.

Turning now to the bottom portion of FIG. 3, preprocessing steps as may enhance synchronization are now described. Such preprocessing may be performed by the preprocessor **60a**. The preprocessor **60a** may be implemented in the server **41** (FIG. 2) or in the personal computer **40a**, or the functions may be shared, as will be appreciated by those skilled in the art. The preprocessing may also be performed by the originating source prior to delivery to the cineplex in other embodiments.

The illustrated preprocessor **60a** is for preprocessing the supplemental audio content to identify quiet portions between adjacent live portions. Since the supplement audio content is preferably spoken words, e.g. dialogue or descriptive narration, there are typically pauses between words, or between phrases or sentences. These pauses, for example, define quiet portions which can be extended or reduced in order to aid synchronization during playing. As an example, a quiet portion may be identified as occurring between reel X, and between block numbers Y and Y+75. Of course, quiet portions can be considerably longer or

Once identified during preprocessing and associated with the identification information that is also used on the motion picture film or which can be correlated therewith, these quiet portions can be extended or reduced by the illustrated sample formatter **57a**. Of course, by reduced is also meant to include the complete reduction or elimination of a quiet portion, and extended is meant to cover the creation of a quiet portion. To reduce noise which may otherwise be generated, the sample formatter **57a** may hold a prior sample during extension of a quiet portion as will be appreciated by those skilled in the art.

15 The preprocessor **60a** illustratively includes
a first memory **61a** for storing the downloaded
supplemental audio content. The supplemental audio
content is upsampled in the illustrated upsampler **62a**
to match the desired play sample rate. The
20 supplemental audio content is then processed to
determine quiet portions and their locations in the
illustrated quiet portion processor and tagger **63a**.
This quiet portion processor and tagger **63a** can be
provided by the microprocessor of the portable computer
25 **40a** of the projection area, or the common server **41** as
will be appreciated by those skilled in the art. This
preprocessed supplemental audio content may then be
stored in the second memory **64a** for use during playing.
This second memory **64a** may typically be the hard drive
30 of the portable computer **40a** associated with the
projection room. Of course, the preprocessed
supplement audio content can also be stored in the
first memory along with the downloaded content, or in
place of the downloaded content.

Turning now to FIG. 4, a movie patron unit **50a** for the supplemental audio content system **30a** is now described. The movie patron unit **50a** delivers the supplemental audio content to the movie patron. The illustrated movie patron unit **50a** includes an earphone **70a** connected to a headband **71a** to be worn on the head of the movie patron. In other embodiments, a pair of earphones may be provided. Also, the headband **71a** may not be needed in other embodiments where the earphone **70a** is otherwise attachable adjacent the movie patron's ear. The earphone **70a** may be an open field earphone that allows the patron to hear the music, sound effects, main dialogue, etc. from the main soundtrack, while also hearing the supplemental audio content from the earphone.

The earphone **70a** is connected to an associated device **73a** via a cable **72a**. The device **73a** may include a housing **74a** containing associated electronics, such as an amplifier **79a** and may also carry level setting switches **75a** on a portion of the housing. A battery, not shown, may also be carried by the housing **74a**. Where the supplemental audio content is an alternate language, selector switches **76a** may be used to allow the movie patron to select the desired alternate language. In other embodiments, the device **73a** may be constructed or arranged together with the earphone **70a**, such as part of a headset, for a more compact arrangement.

In some other embodiments, such as for construction of a new cinema, wiring may be run to each movie seating position, so that the movie patron unit **50a** may be a simple headset which plugs into a suitable jack at the seating position. It should be recognized by those skilled in the art, however, that retrofitting

0906694-062904

such extensive wiring to an existing cinema may be cost prohibitive. Accordingly, another aspect of the supplemental audio content system **30a** is that a wireless communications link may be used instead of wired links to each movie seat position. Thus, the device **73a** may include a wireless receiver **80a** carried within the housing **74a** as will be described in greater detail below. Moreover, since motion pictures are typically now shown in cineplexes **20** including multiple cinemas **21a-21d**, it is also highly desirable that interference be suppressed between adjacent systems using wireless communications links.

Referring now additionally to FIGS. 5-7, various embodiments of wireless transmitters and receivers for implementing wireless communications links are now described. In particular as shown in FIG. 5, to reduce interference, the wireless transmitter **42a** may include a digital modulator **44a**. Correspondingly, the wireless receiver **80a** may include a digital demodulator **81a**. For example, the digital modulator and demodulator may operate over radio frequency bands or in the infrared band.

Infrared operation offers the advantage that infrared radiation will not pass through the walls of the cinema, therefore interference with adjacent cinemas is prevented. However, delivering the infrared signals within the cinema requires that there be no substantial blockage between the transmitter and each receiver.

RF operation offers the advantage over infrared of being less susceptible to blockage of a direct path between the transmitter and the receivers; however, RF operation may be more susceptible to interference. The digital modulation may offer

multiple channels within the cineplex **20** that are less likely to interfere with one another. Of course, those of skill in the art will appreciate other equivalent wireless communications schemes that provide reduced interference, but provide the advantages of wireless communications.

One method aspect in accordance with the invention is for providing supplemental audio content during playing of a motion picture film including identification data thereon. The method preferably comprises generating time tagged identification data based upon a clock and the identification data from the motion picture film during playing thereof, and synchronizing playing of the supplemental audio content with playing of the motion picture film and based upon the time tagged identification data. Synchronizing may comprise playing the supplemental audio content at a play rate based upon the time tagged identification data to synchronize with playing of the motion picture film. In addition, synchronizing may skip ahead or wait while playing the supplemental audio content based upon the time tagged identification data to synchronize with playing of the motion picture film.

Another method aspect of the invention is for delivering supplemental audio content to at least one movie patron during playing of a motion picture film and associated soundtrack in a cinema of cineplex **20** comprising a plurality of individual cinemas **21a-21d**. The method may include providing at least one movie patron unit **50a** comprising an earphone **70a** and a wireless receiver **80a** connected thereto, and wirelessly transmitting the supplemental audio content from a wireless transmitter to the at least one movie patron unit **50a** to thereby deliver supplemental audio content
